SLIDE 1 of 14

Secure Azure Networks

DRAW:

Nothing to draw -- you're on this 30 seconds. If you want one mark, underline "Secure Networking" on the title as you name the domain.

SLIDE 2 of 14

The Problem: Peering Isn't Segmentation

DRAW:

Two boxes, VNet A and VNet B, dashed line between them. Write AllowVNetInBound on the dashed line and underline it. Draw nothing that looks like a firewall anywhere near it -- the blank space is the point.

SLIDE 3 of 14

NSGs: Where They Apply & Evaluation Order

DRAW:

Subnet box with a shield around its edge (subnet NSG), VM inside with its own small shield (NIC NSG). Inbound arrow: subnet shield first, then NIC shield. Outbound arrow: NIC shield first, then subnet shield -- the reversed order is the payoff.

SLIDE 4 of 14

NSG Rules: Parameters & Defaults

DRAW:

Vertical list of rule rows by priority, arrow down labeled "lower number wins," stop sign at the first match. Underneath: the three default rules each with a padlock.

SLIDE 5 of 14

Creating & Associating an NSG

DRAW:

Shield floating alone, dotted outline, "does nothing yet." Arrow connecting it to a subnet/NIC box, outline turns solid once it lands. Two steps, not one.

SLIDE 6 of 14

Application Security Groups

DRAW:

One VM inside two overlapping shapes: ASG: Web and ASG: SQL. One rule arrow from a single ASG source to a single ASG destination; cross out a second ASG on either side.

SLIDE 7 of 14

User-Defined Routes

DRAW:

One subnet, one route table -- emphasize "one." Gray arrows for defaults (VNet range, 0.0.0.0/0 -> Internet), bold arrow overriding toward a firewall diamond. Separate sketch: Next Hop = None as an arrow stopping dead at a black square.

VNet Peering & Hub-Spoke

DRAW:

Hub box, on-prem cloud with solid S2S line in, spoke 1 and spoke 2 each dashed-peered to the hub only -- no line between the spokes. Trace the missing gap with your pointer.

SLIDE 9 of 14

VPN Gateway & Authentication

DRAW:

One gateway box in the hub, four lines to P2S (laptop), S2S (on-prem cloud), VNet-to-VNet (VNet box), Multi-Site (multiple clouds) -- one gateway box drawn once. Separately: certificate, RADIUS, Entra ID icons, "OpenVPN only" next to Entra ID.

SLIDE 10 of 14

Virtual WAN

DRAW:

Three or four hub boxes, each with its own spokes, every hub connected to every other hub directly -- a small mesh. Label it "hub of hubs."

SLIDE 11 of 14

Encryption & PaaS Firewalls

DRAW:

MACsec: thick, fully shaded ExpressRoute line (everything, even BGP). IPsec: a lock icon only on the payload, lighter shading. Separately: storage account box with a three-position dial for Public Network Access.

SLIDE 12 of 14

Network Watcher

DRAW:

Magnifying glass over VM/VNet/load-balancer boxes only; PaaS box grayed out/crossed. Five tool icons in a row: IP Flow Verify (check/X arrow), Next Hop (fork in road), Effective Security Rules (two shields merging), Diagnostics/Troubleshoot, Flow Logs (ledger).

SLIDE 13 of 14

Bringing It Back to My Own Lab (LIVE DEMO)

DRAW:

Four-box timeline: Phase 1 (ASG+override), Phase 2 (UDR fight), Phase 3 (gateway/cert/Entra), Phase 4 (magnifying glass) -- circle Phase 2. Live demo UDR segment: two panels side by side -- before (peering line winning, firewall unused) and after (new route, traffic through firewall). Leave both up.

SLIDE 14 of 14

Questions???

DRAW:

Nothing planned. If the cert roadmap comes up: ENCOR (done) -> ENARSI (next) -> hiatus.
